Chemical Head Lice Products

- Pyrethrins eg Amcal Head Lice Foam, Lyban Foam
- Synthetic Pyrethroids (bioalletrhin, permethrin) eg Paralice, Quellada Head Lice Treatment
- Organophosphates eg Exolice Medicate Foam, Lice Rid
- Combinations of Herbal and Essential Oils eg Quit Nits Natural Head Lice Treatment, Herba Lice

Treatment Outcomes

It is essential to check the effectiveness of every treatment after a product has been on the hair for the recommended amount of time and before washing it out:

- Comb the hair with a fine tooth head lice comb, wiping the comb onto a white tissue after each sweep.
- Repeat until whole head is combed and little treatment formulation is visible on the hair.
- After 5 minutes examine the tissues and assess the lice as dead (no movement), inactive (louse is stationary but moving legs or antennae), or active (louse moving).
- If the product is effective, all lice should be dead.

What to do if the product doesn’t work

If the product is not effective, ie head lice are not dead at the end of exposure time, you can switch to the non-chemical method while waiting 7-10 days before re-treating with a different active ingredient. Continue checking the effectiveness of treatment products until an effective product is found, or use the non-chemical method.

Prevention

While there is no need to vacuum, wash or treat with insecticide any furniture, clothing, bedding (except pillowcases), toys, carpets or hats, the following actions can be taken to help to prevent infestation/re-infestation:

- Avoid head to head contact with other persons
- Keep long hair tied back or in plaits, especially at school.
- Do not share brushes, combs or pillows
- Wash combs and hire brushes after each use (60°C for 30 seconds)

- Pillow cases of persons known to be infested should be washed daily on hot cycle or put in the clothes dryer for 15 minutes
- Treat all household members whose head lice have been detected.
- Keep hair short, particularly during an outbreak. It is easier to detect and treat head lice in short hair.
- Notify your school so that others can be alerted to the problem and can check for head lice and arrange treatment if necessary.

Some information about......

Head Lice

This information has been obtained from a Queensland Health Fact Sheet. Fact sheets on this and other topics can be found at www.health.qld.gov.au
What are they?

Head Lice (Pediculus capitis) are small, wingless, egg laying insects found on the human head. They grow to about 3.5mm (the size of a sesame seed or pin head). Head lice live on the hair and feed by sucking blood from the scalp. They are pale grey in colour before feeding and reddish brown after feeding.

Live eggs (sometimes called nits) are glued to the hair shaft within a distance of 1.5cm from the scalp. They hatch in 7-10 days as young lice (nymphs). It takes up to ten days to become mature lice and begin laying eggs. Adults are larger than nymphs and a mature female lays up to eight eggs per day. Adults are larger than nymphs and a mature female lays up to eight eggs per day. They are greyish if they’ve not been eaten or reddish brown when they have been eaten.

The life cycle of a head louse

- Young adults become reddish brown after it eats for the first time.
- The lifespan is about 5 weeks.
- Louse = one
- Lice = more than one
- 6 – 10 days to become an adult
- 7 – 10 days to hatch
- 1.5cm from scalp
- Eggs are yellowish brown to pale cream
- Real size egg
- Real size head lice

Transmission

- Head lice do not fly or jump.
- They are spread mainly by direct head to head contact.
- They have strong claws and move by swinging from hair to hair.
- This can happen when people play, cuddle or work closely together.
- A few head lice have been found on combs, hairbrushes and pillow cases. However, transmission from these items can only occur when the item is used within the 24 hour period following use by a person with head lice.
- Head lice can survive only up to a day away from the human host.
- Head lice must feed on human blood every six hours to replenish their water supply or they will die of dehydration. The longer they are away from a human host, the weaker they become and the less likely they are to infest the next person.
- Head lice do not live or breed on animals, bedding, furniture, carpets, clothes or soft toys.

Detection of Head Lice

The most effective way to detect head lice is by using the hair conditioner and combing method. You will need white coloured hair conditioner, an ordinary comb, a fine tooth head lice comb and white tissue. Conditioner and combing method. You will need white coloured hair conditioner, an ordinary comb, a fine tooth head lice comb and white tissue.

- Apply sufficient white conditioner to dry hair to cover the scalp and hair from roots to tip.
- Use an ordinary comb to detangle hair and evenly distribute the conditioner. Divide the hair into four sections.
- After each stroke, wipe the comb onto a white tissue, checking the comb and tissue for head lice.
- Comb the whole head, checking for lice
- Put all tissues in a plastic bag, tie the top and put the bag in a rubbish bin.

All members of the family/household should be checked once per week using this method as long as there are head lice in the household.

Treatment

Non-insecticidal treatment using the conditioner and combing technique.

- This is the same as detection using conditioner and combing (as detailed above) except continue combing with the head lice comb until all the conditioner is gone. The conditioner blocks the louse’s breathing pores and stuns the louse. This, together with the slippery effect of the conditioner, makes it easy to mechanically remove the lice.
- Repeat this method every second day to remove the young nymphs as they hatch. Continue until no live lice are found for ten consecutive days.

This treatment is just as effective as insecticidal or other chemical treatments but generally requires longer treatment times. However, it may be preferred as a cheaper alternative to insecticidal or other chemical treatments.

Treatment with synthetic or natural insecticides or other chemicals.

- There are four groups of treatment agents available in different forms (ie shampoo, mousse and lotion) which can be obtained from chemists without prescription.
- All preparations must be applied strictly according to the manufacturer’s instructions. None of them should be used on children under two years of age, except on medical advice.
- No chemical treatment kills all the eggs. A second treatment should be applied 7-10 days after the initial treatment to kill the nymphs that have hatched from the eggs remaining from the first treatment.
- Do not apply the treatment more than once per week as more frequent applications could lead to scalp problems and have little or no effect.
- If lice are still found after three weeks of chemical applications, switch to the non-insecticidal method until no lice are found.
- Eggs are the most difficult stage to kill. The most effective way to remove eggs is to actually pull them off the hair using your fingernails.
